

Example: integration map for brief 4, ticket to work order

What this is: The Day 4 integration map filled in for use case brief 4, the way a group might write it at the end of Day 4. The plant is the fictional Sabkha Gas Plant (SGP); the pump is P-1201A at MRB, and the May seal job is WO-118305. It shows the level of detail we are after. It is one answer, not the answer, and it leaves real gaps open on purpose. The ERP is the fictional Tavrona ERP; the lab's mock ERP stands in for it. Synthetic program material: no real OQ data.

Field	Answer
Author	Example group (brief 4)
System	Brief 4: ticket to work order (agents)
Date	Day 4, 30 September 2026

1. The map, as first written

System	Role	Direction	Reach today	Access	Owner	Day 5	Blocker
Service desk (tickets)	system of record	read	JSON export of the 600 tickets; production feed OPEN	have	?	real	a read-only API token, and a name to ask
Tavrona ERP	system of record	read+write	REST API; the lab's mock ERP stands in for it	requested	planning lead, MRB (?)	real	ERP owner signs the write policy; a service account that can POST /work-orders and nothing else
Approval queue (planner)	approval and notification	read+write	the class's approval form; production OPEN	have	planning lead, MRB (?)	real	where planners actually look during a shift
Model API (vendor)	the model	call	HTTPS, one key held by the team	have	whoever signed the vendor terms	real	data classification sign-off: tickets and maintenance history are internal
ProcessLens	operator screen	read	none	none	control room supervisor (?)	out	not touched: the alarm text is already in the ticket

The trust boundary

System	Direction	Authority	Trust	Egress	Session
Service desk (tickets)	read	read-only, the one ticket in front of the agent	untrusted	internal	main
Tavrona ERP	read+write	1 work order per source ticket, priority 2 to 4, after a named planner approves the exact body	untrusted	internal	main
Approval queue (planner)	read+write	drafts only. Approving here is the only route to the ERP write	untrusted	internal	main
Model API (vendor)	call	n/a	trusted	none	main
ProcessLens	read	n/a	trusted	none	main

2. The four checks

#	Check	Result	Row
1	The triangle	no finding	No row is a model-chosen way out of the session. The ERP write is internal and a person reads it first
2	The unbounded write	no finding	Both writes carry an authority line
3	The fiction	FINDING	Tavrona ERP: marked real for Thursday, and access is requested
4	The read-only egress	no finding	No external hop

- The fix, and what it costs.

One field: Tavrona ERP goes from real to mock, and the blocker says what the mock stands in for. After that the sheet reports 0 findings. A row changed; no prompt improved. The write on Thursday is to the mock ERP, and that is now written down as a decision instead of discovered at 11:00.

- What the checks do not tell us.

They read what we wrote. Nothing on the sheet says what reads the work order text after it is raised. The site crew does, and the crew's list is an egress we ticked as internal.

3. The ask list

System	What we need	Who	By when
Service desk (tickets)	name the person who owns it	OPEN	OPEN
Tavrona ERP	name the person who owns it	OPEN	OPEN
Tavrona ERP	access: REST API; the lab's mock ERP stands in for it (requested today)	OPEN	OPEN
Tavrona ERP	sign-off on the write policy: 1 work order per source ticket, priority 2 to 4, after a named planner approves the exact body	OPEN	OPEN
Approval queue (planner)	name the person who owns it	OPEN	OPEN
Approval queue (planner)	sign-off on the write policy: drafts only. Approving here is the only route to the ERP write	OPEN	OPEN

Every line needs a name and a date before Thursday. This is page one of the governance pack.

4. The build list

Thursday	System	What has to be true, or what it stands in for
real	Service desk (tickets)	a read-only API token, and a name to ask
real	Approval queue (planner)	where planners actually look during a shift
real	Model API (vendor)	data classification sign-off: tickets and maintenance history are internal
mock	Tavrona ERP	ERP owner signs the write policy; a service account that can POST /work-orders and nothing else
out	ProcessLens	documented, not touched

- Which row does S26 build a server for?

Tavrona ERP. It is the one row marked mock that writes, and the MCP server in front of it is the artifact we carry away.
